Water Resource Management:
Geography/Environmental Studies 4411

Instructor: Graham Saunders
graham.saunders@lakeheadu.ca

Graham Saunders

- Australian Weather Bureau
- Environment Canada
- Ministry of Natural Resources
- M.Sc. in Forestry and Climatology
- Teaching at LU since 1995
  - **Proposed, designed, teach Lake Superior course**
  - Climate Change Research – boreal forest
  - Severe Weather prediction and adaptation
  - Thunder Bay's vulnerability to flood and other severe weather
- Decades of writing about weather, climate, Lake Superior, agriculture, pricing carbon and related policy issues

Topics for discussion

- Goals/expectations of the course
- Assigned Reading (no text purchase)
- Evaluation
  - Assignments/Briefings
  - In-class workshops
  - Midterm Final?
- Independent Research Project
- Proposal Report Seminar "Debate"
- Field trip

Geography/Environmental Studies 4411: Water Resources Management

Lectures/Seminars: Tuesday and Thursday
Time: 1430 – 1600

Course content Session: Winter 2018

This course provides an overview of water issues:
Various connections between water and social needs such as food, energy production, economic activities, transboundary water conflicts and co-operation and human health.

Topics include the qualities, values, and uses of water — consumptive and non-consumptive; economic and environmental; some major regional and global water management issues; water supply reliability; challenges to maintain and improve long-term quality.

Major themes include water supply, water quality, hydropower and flood control. The term research project may either be on a Canadian topic or on a more theoretical topic with international examples

Course Evaluation

Five (5) Assignments/Briefings (5 x 4)	20
One planning exercise	10
Midterm:	30
Independent Research Project: (Proposal, Abstract, Paper)	30
Debate/focused discussion	10

Field Trip: January?

Atlantic Avenue Water Pollution Control Plant (WPCP)

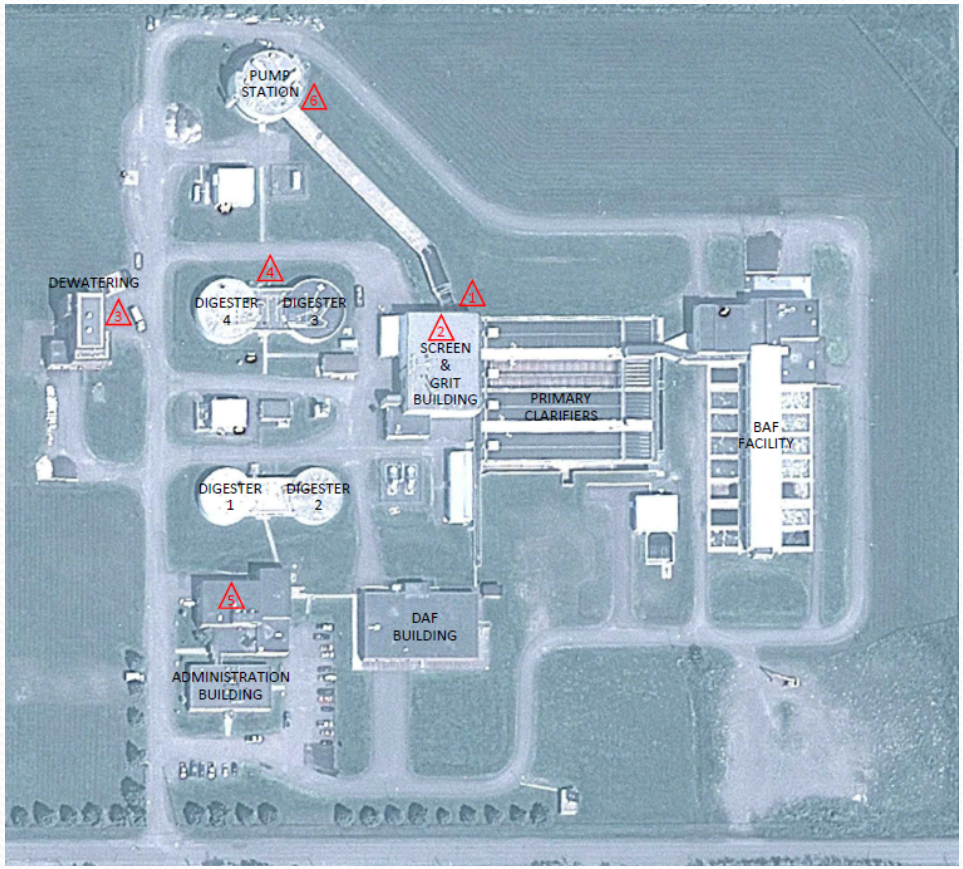
OR

Bare Point Water

Treatment Plant

Leave LU at 1415 am

Return approx. 1645



Assignment 1
Public lecture by David Schindler

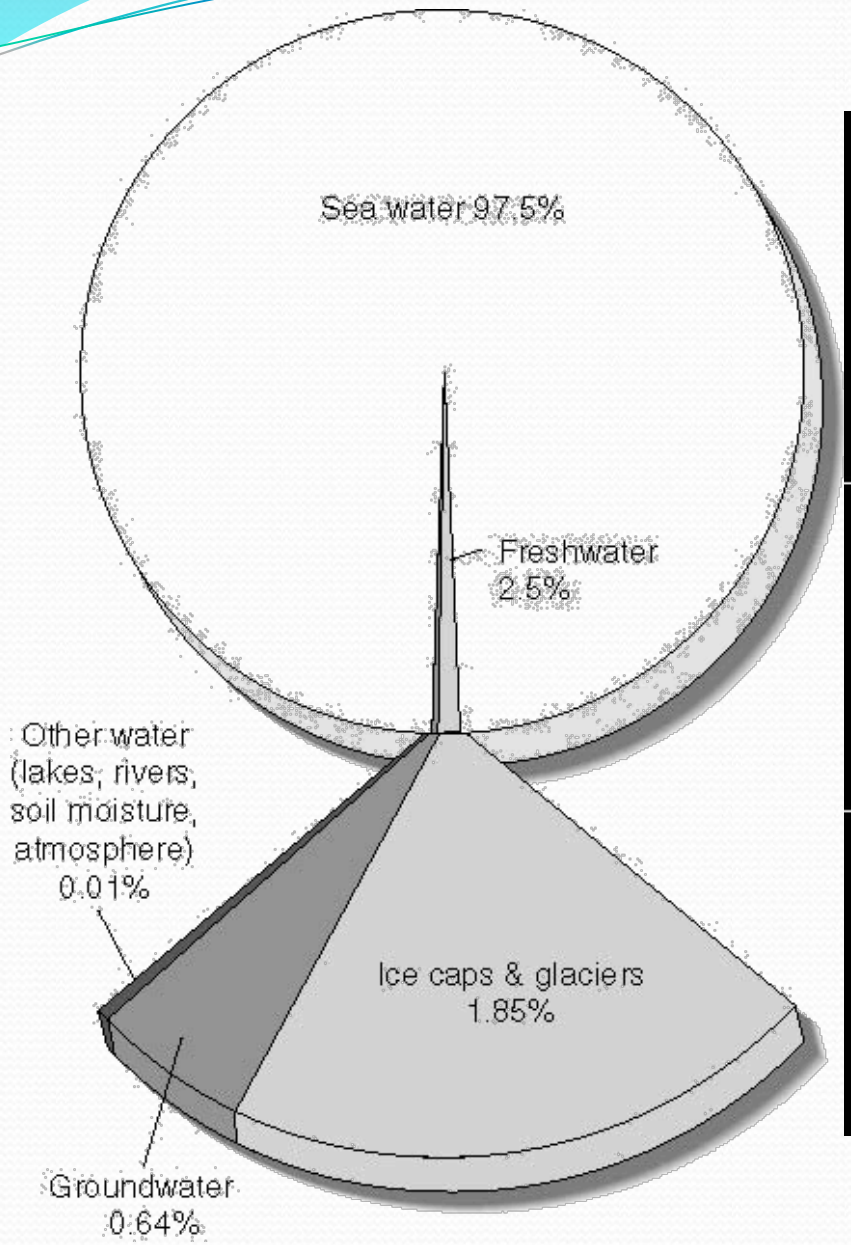
Bio of David Schindler: research and expertise in fish, mercury, various aquatic issues

Public lecture by David Schindler (recorded on June 18,2014) in Waterloo, Ontario. The lecture was titled *Canada's Freshwater in the 21st Century* and is about 61 minutes in duration.

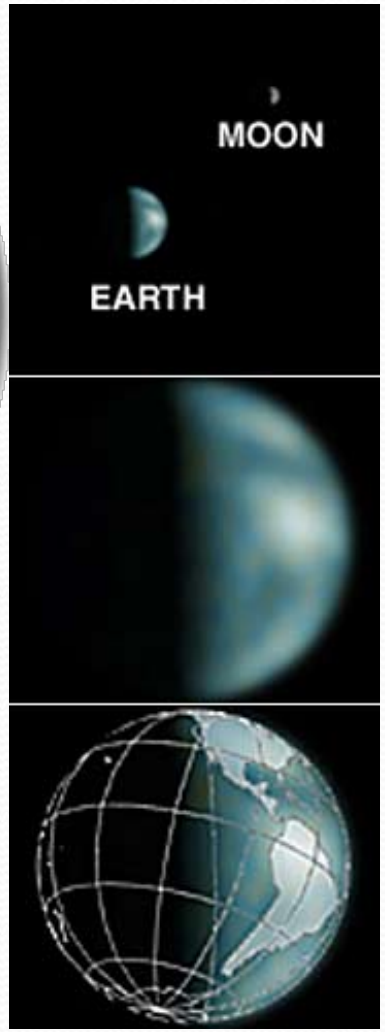
Word count: 400 to 500

Lecture 1:
A Global Water Crisis?

- Water resources
- Security
- Freshwater Supply
- Modification
- Future Stressors
- Resource Management



View of Earth from Mars



Groundwater – an integral part of the hydrological cycle

- Est. 4.2 million km^3 of groundwater
- Within 1 km of Earth's surface

Compared to:

- 125,000 km^3 freshwater lakes
- 1250 km^3 in streams

TABLE 4.4 Estimated Residence Time of the World's Water Supply

Water Type	Residence Time
Oceans and seas	4000 years (approx.)
Lakes and reservoirs	10 years (approx.)
Swamps	1–10 years (approx.)
Rivers	2 weeks
Soil moisture	2 weeks–1 year
Groundwater	2 weeks–10,000 years
Icecaps and glaciers	10–1000 years
Atmospheric water	10 days

Source: Adapted from R. Allen Freeze and John A. Cherry, *Groundwater* (Englewood Cliffs, NJ: Prentice-Hall, 1979), 5.

Canada

- ***0.5% of world's population***
- ***20% of global freshwater***
- ***Lake Superior: 10%***
- ***25% of wetlands (recharge)***
- ***7% flow of renewable water***

Economic value of …

$7.5-$23 billion annual contribution to Canada's economy

Discuss this estimate

Global Water Security

Control of Water Resources : where water supplies or access to water is at the root of tensions.

Military Tool : where water resources, or water systems themselves, are used by a nation or state as a weapon during a military action.

Political Tool: where water resources, or water systems themselves, are used by a nation, state, or non-state actor for a political goal.

Terrorism (non-state actors): where water resources, or water systems, are either targets or tools of violence or coercion by non-state actors.

Military Target: where water resource systems are targets of military actions by nations or states.

Development Disputes (state and non-state actors): where water resources or water systems are a major source of contention and dispute in the context of economic and social development.

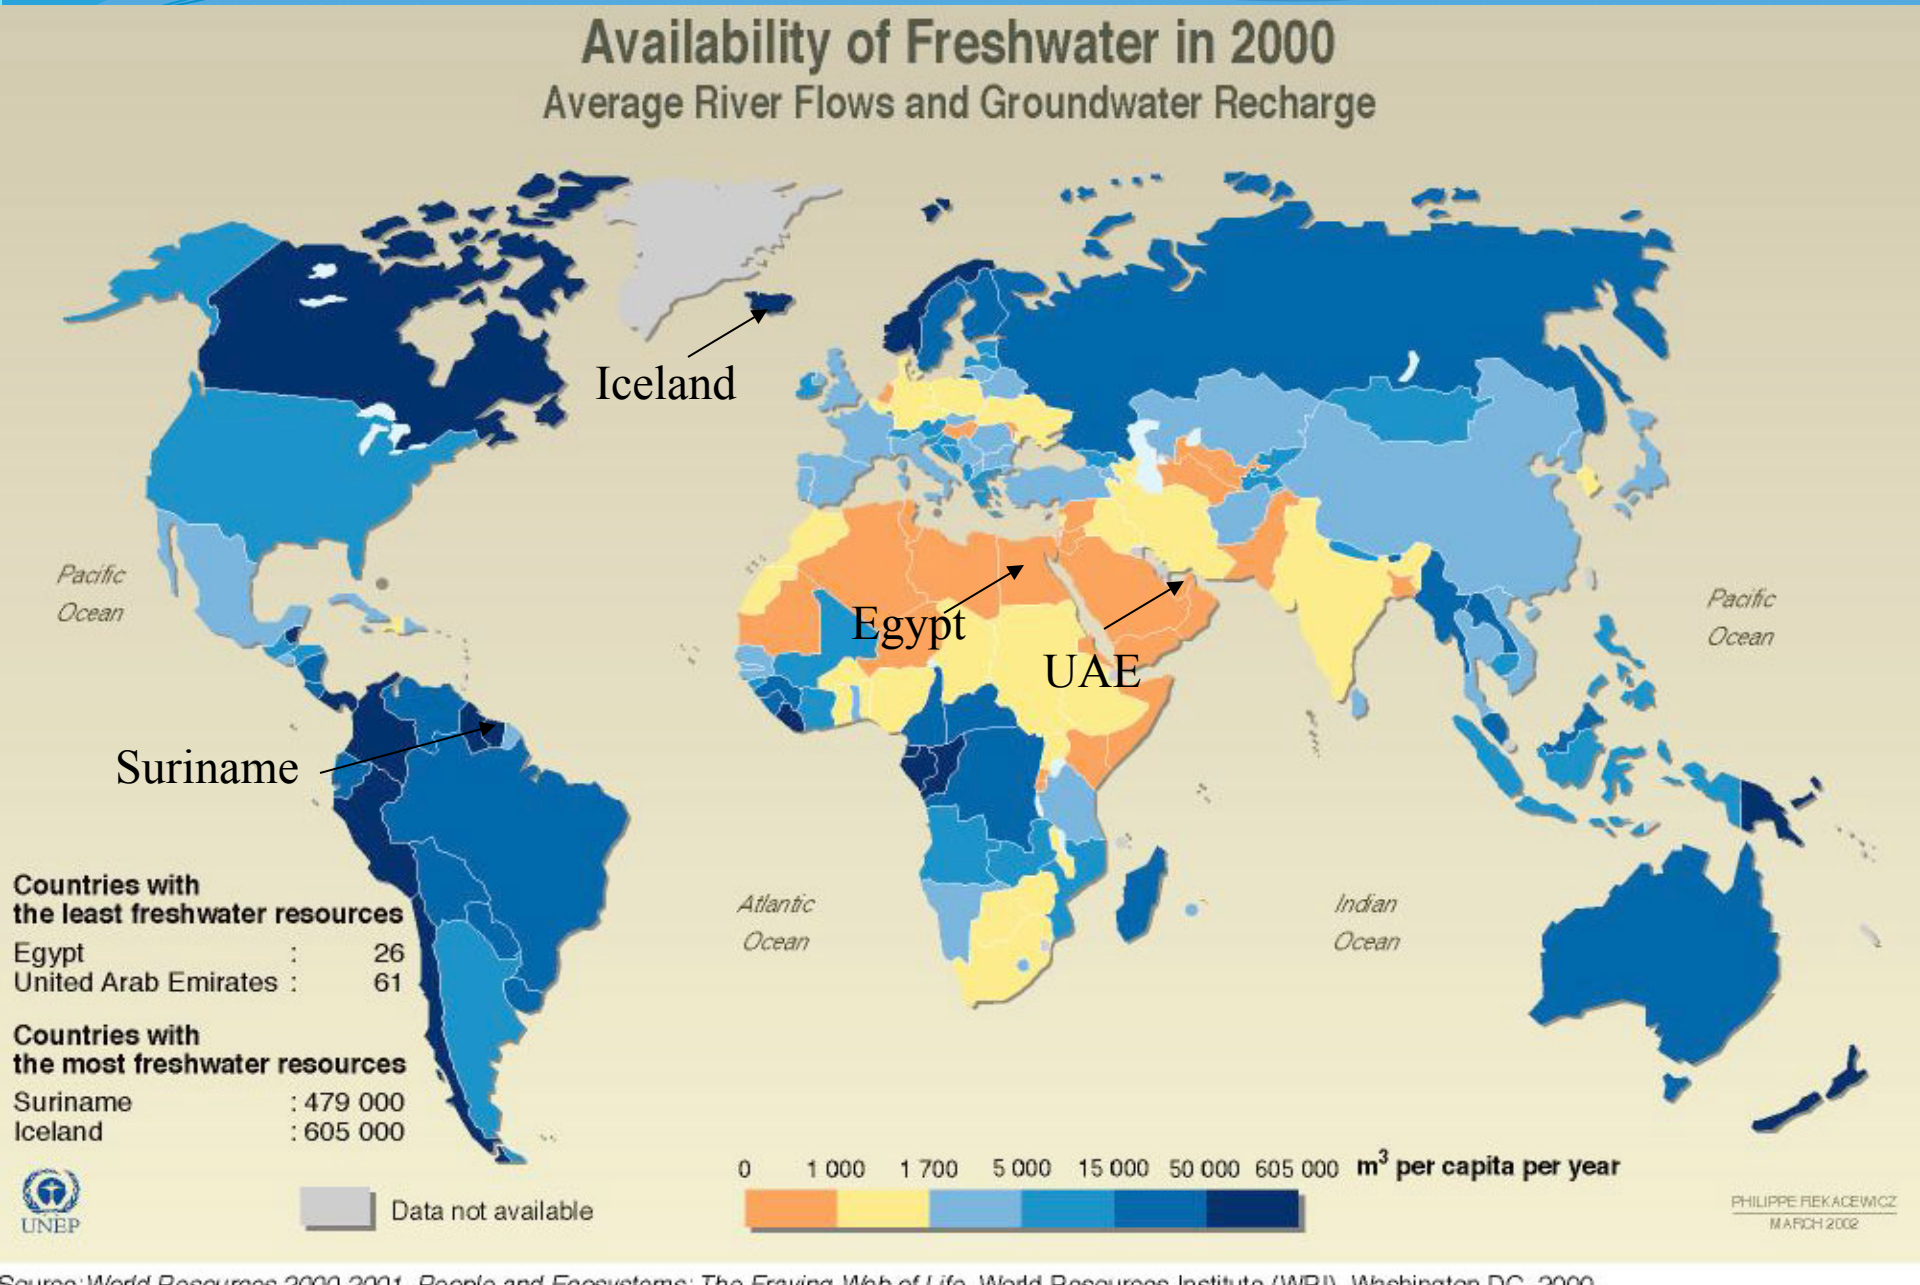
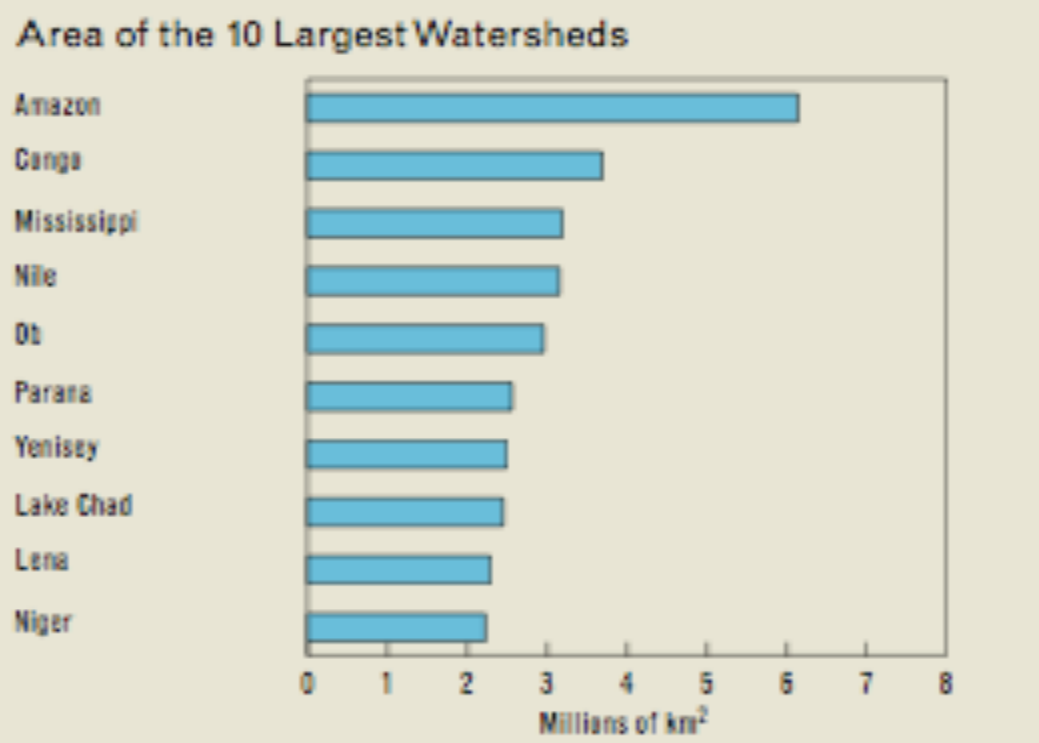
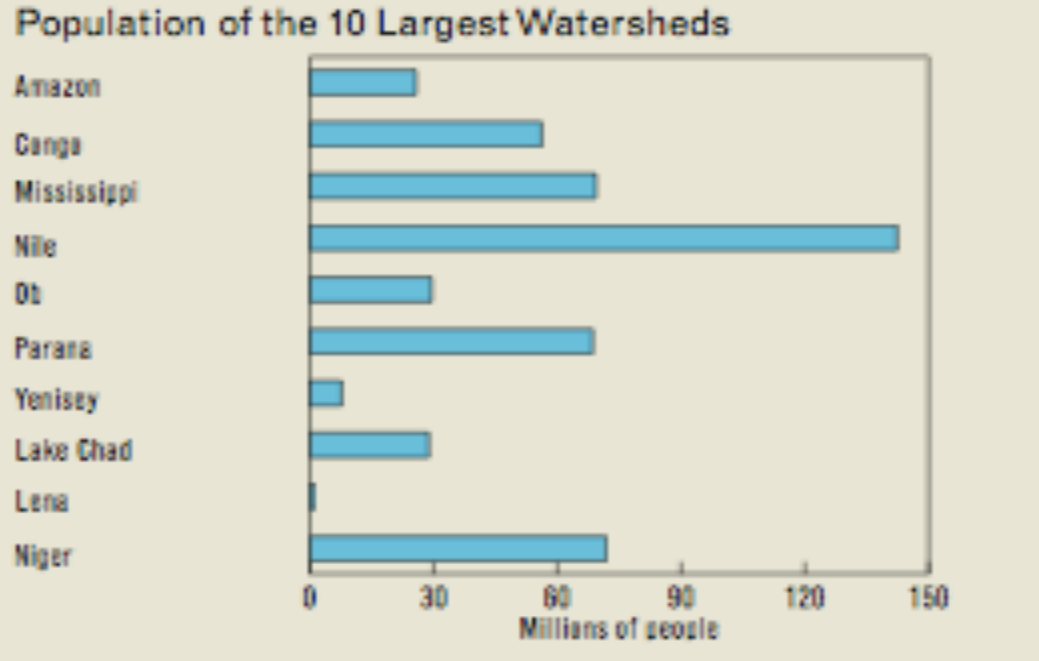
Global Water Issues



Source: *World Resources 2000-2001, People and Ecosystems: The Fraying Web of Life*, World Resources Institute (WRI), Washington DC, 2000





Sufficient quantity/quality of water adequate for human use:

- 1.4 billion people globally without access to safe water supplies
- 2/5 without adequate sanitation
- Humans become thirsty after losing 1% of bodily fluids
- Danger of death at 10%

- 41%, or 2.9 billion people, under water stress, per capita water availability is less than 1,700 m3/year
- Of these, 2.1 billion people in highly stressed river basins where annual water availability is less than 1,000 m3/ person.
- Assuming current consumption patterns continue, by 2025, at least 4 billion people, will live in water-stressed river basins.

Modification of Water Resources

Global demand in the 20th and 21st century

- Population growth
- Industrialization
- Expansion of irrigated agriculture

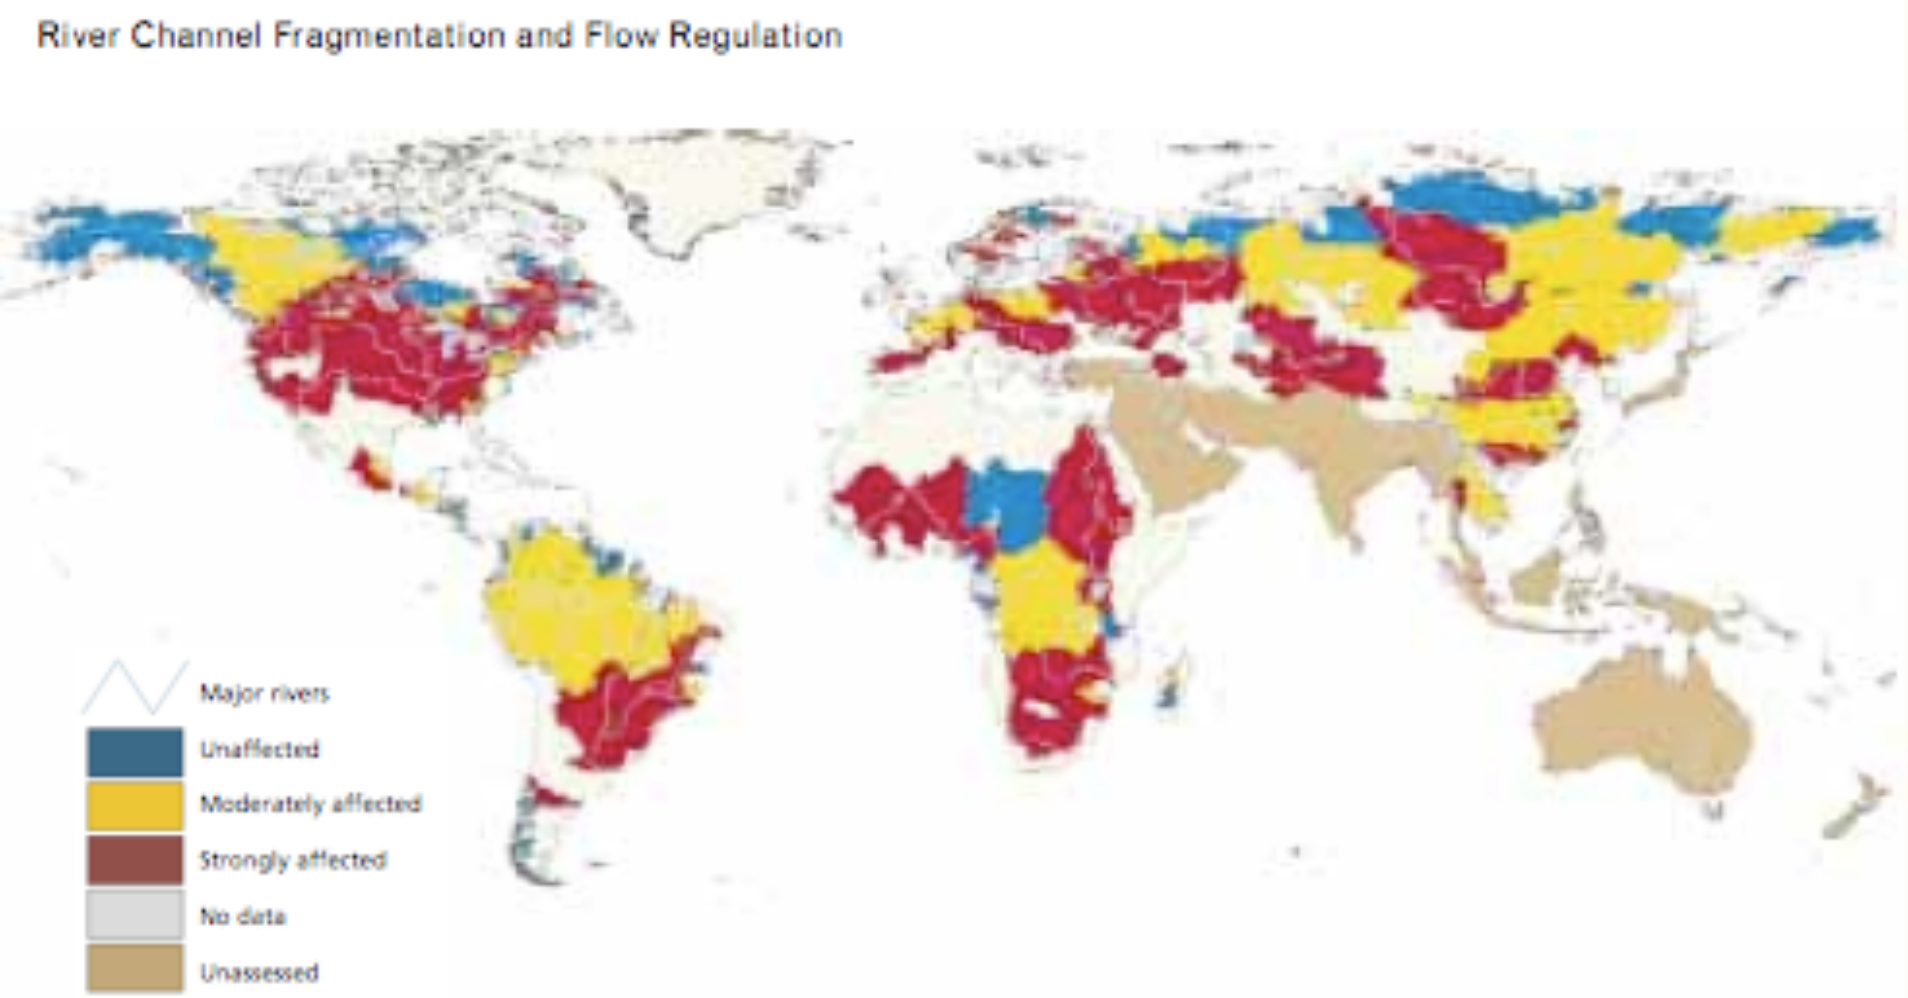
Change in rivers, lakes, reservoirs

- Altering waterways

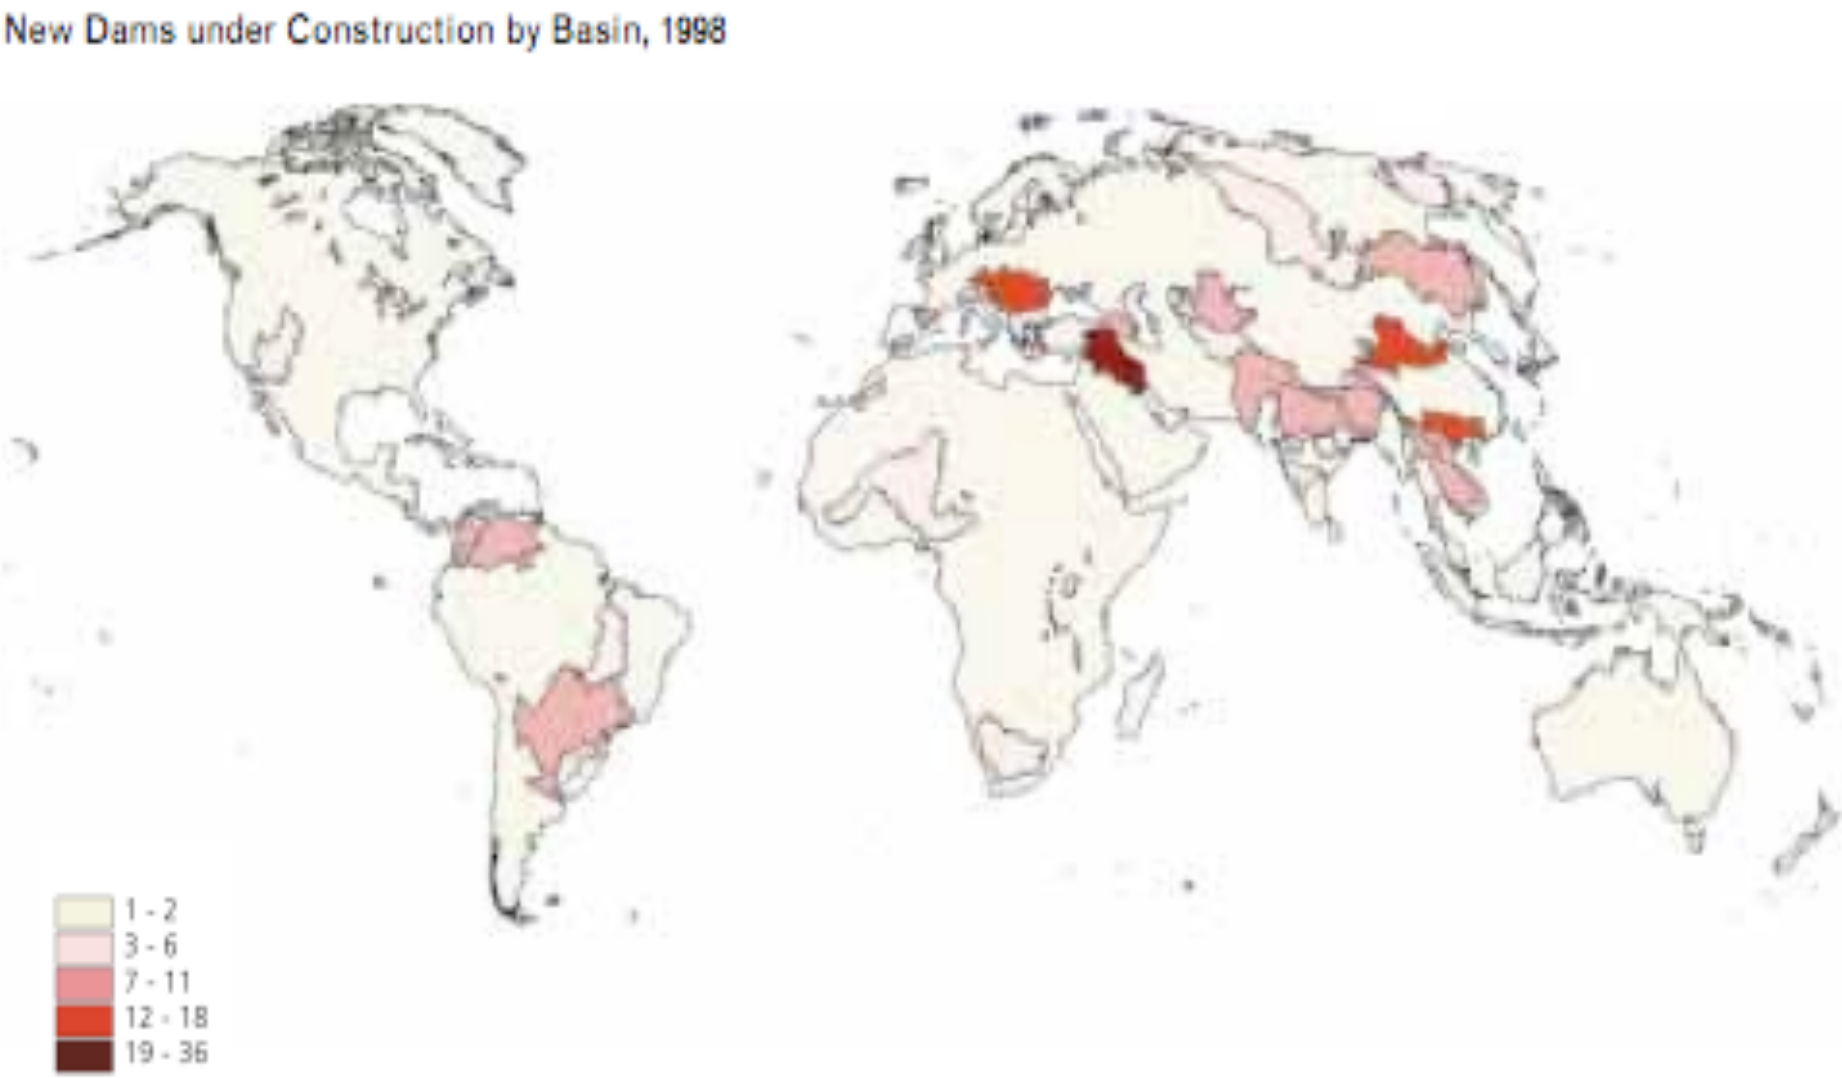
  - draining wetlands

  - constructing dams and irrigation channels

  - Connecting water basins with canals, pipelines, water transfer)

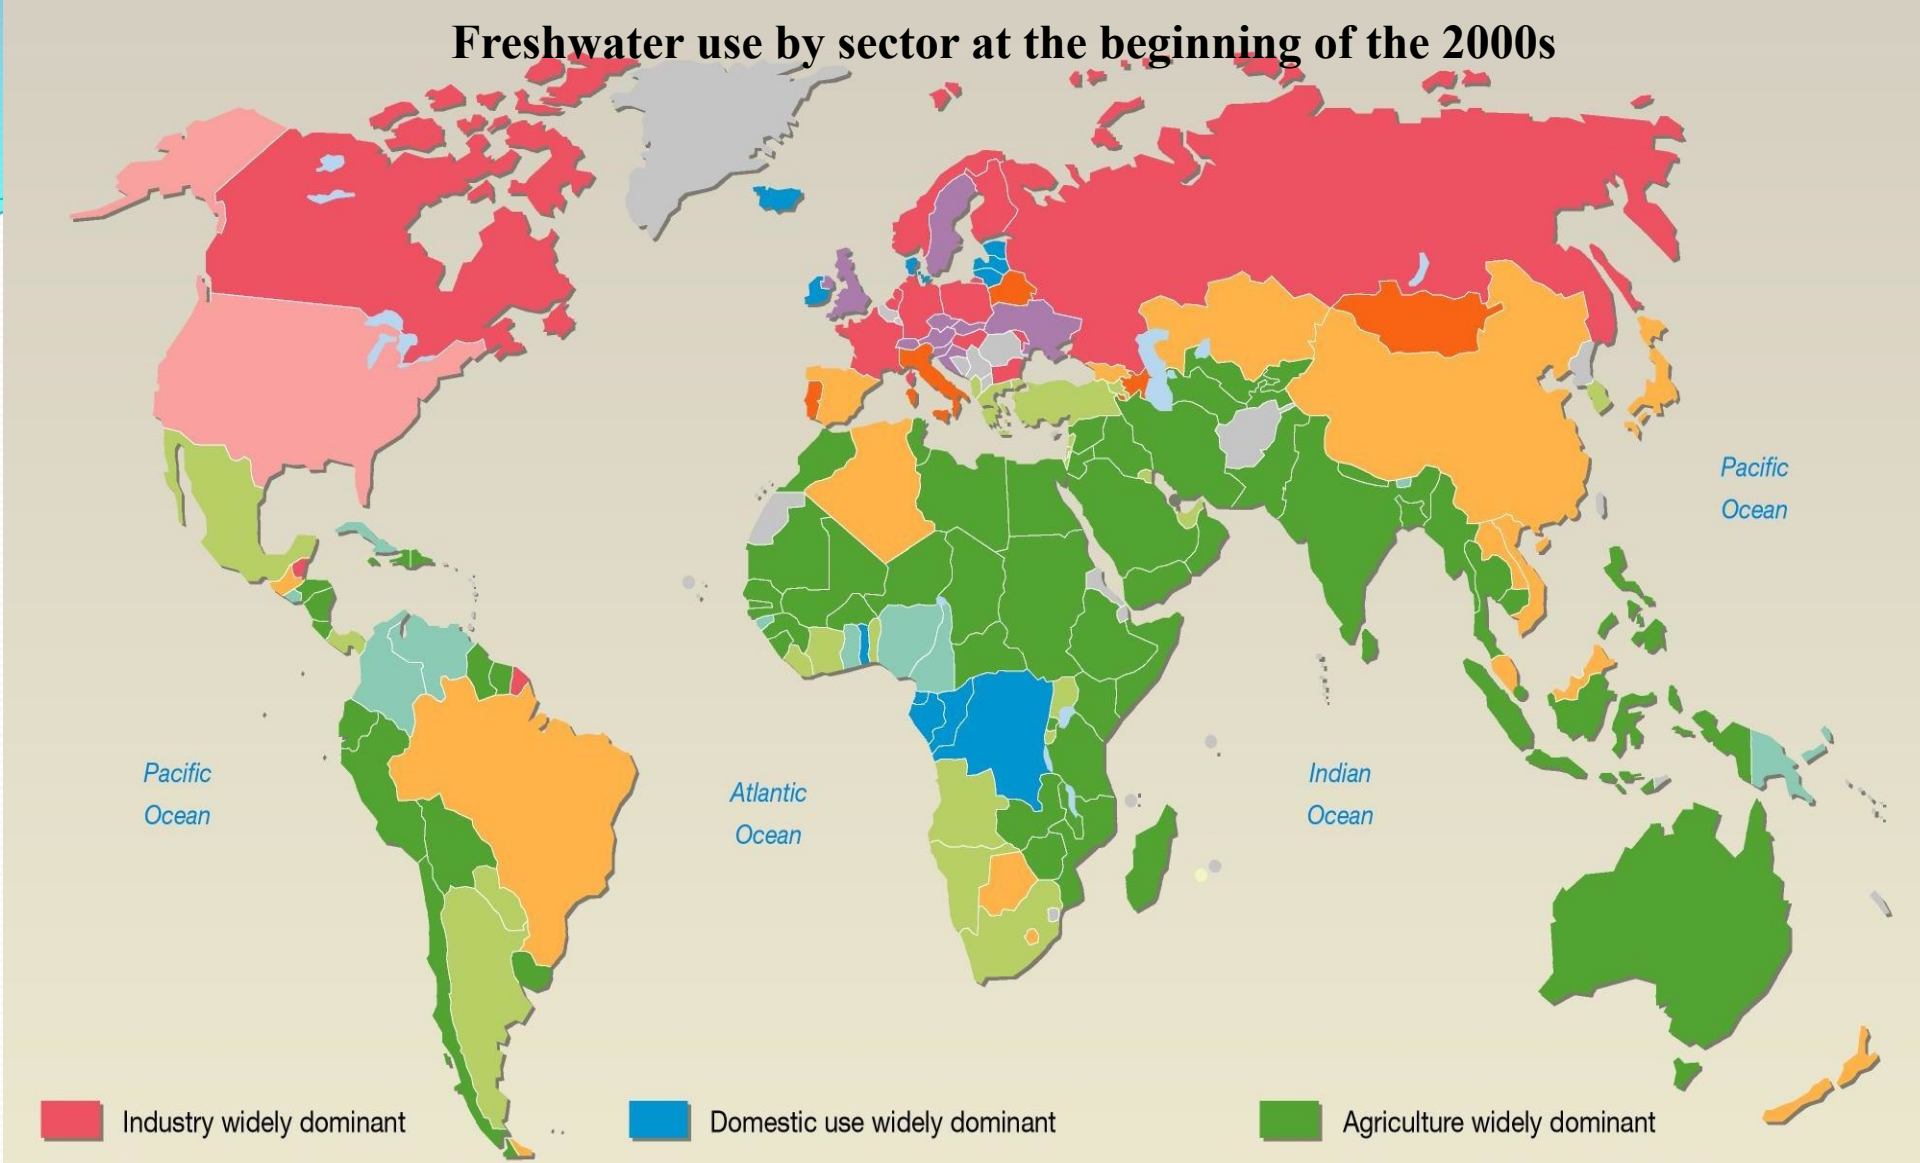


The map shows the extent of fragmentation, or interruption of natural flow, caused by human intervention in 227 large river systems



Dams slow the rate of natural flow, thereby increasing sedimentation and lowering levels of dissolved oxygen.

Freshwater use by sector at the beginning of the 2000s



Source: Based on data fromTable FW1 in *World Resources 2000-2001, People and Ecosystems: The Fraying Web of Life*, World Resources Institute (WRI), Washington DC, 2000.

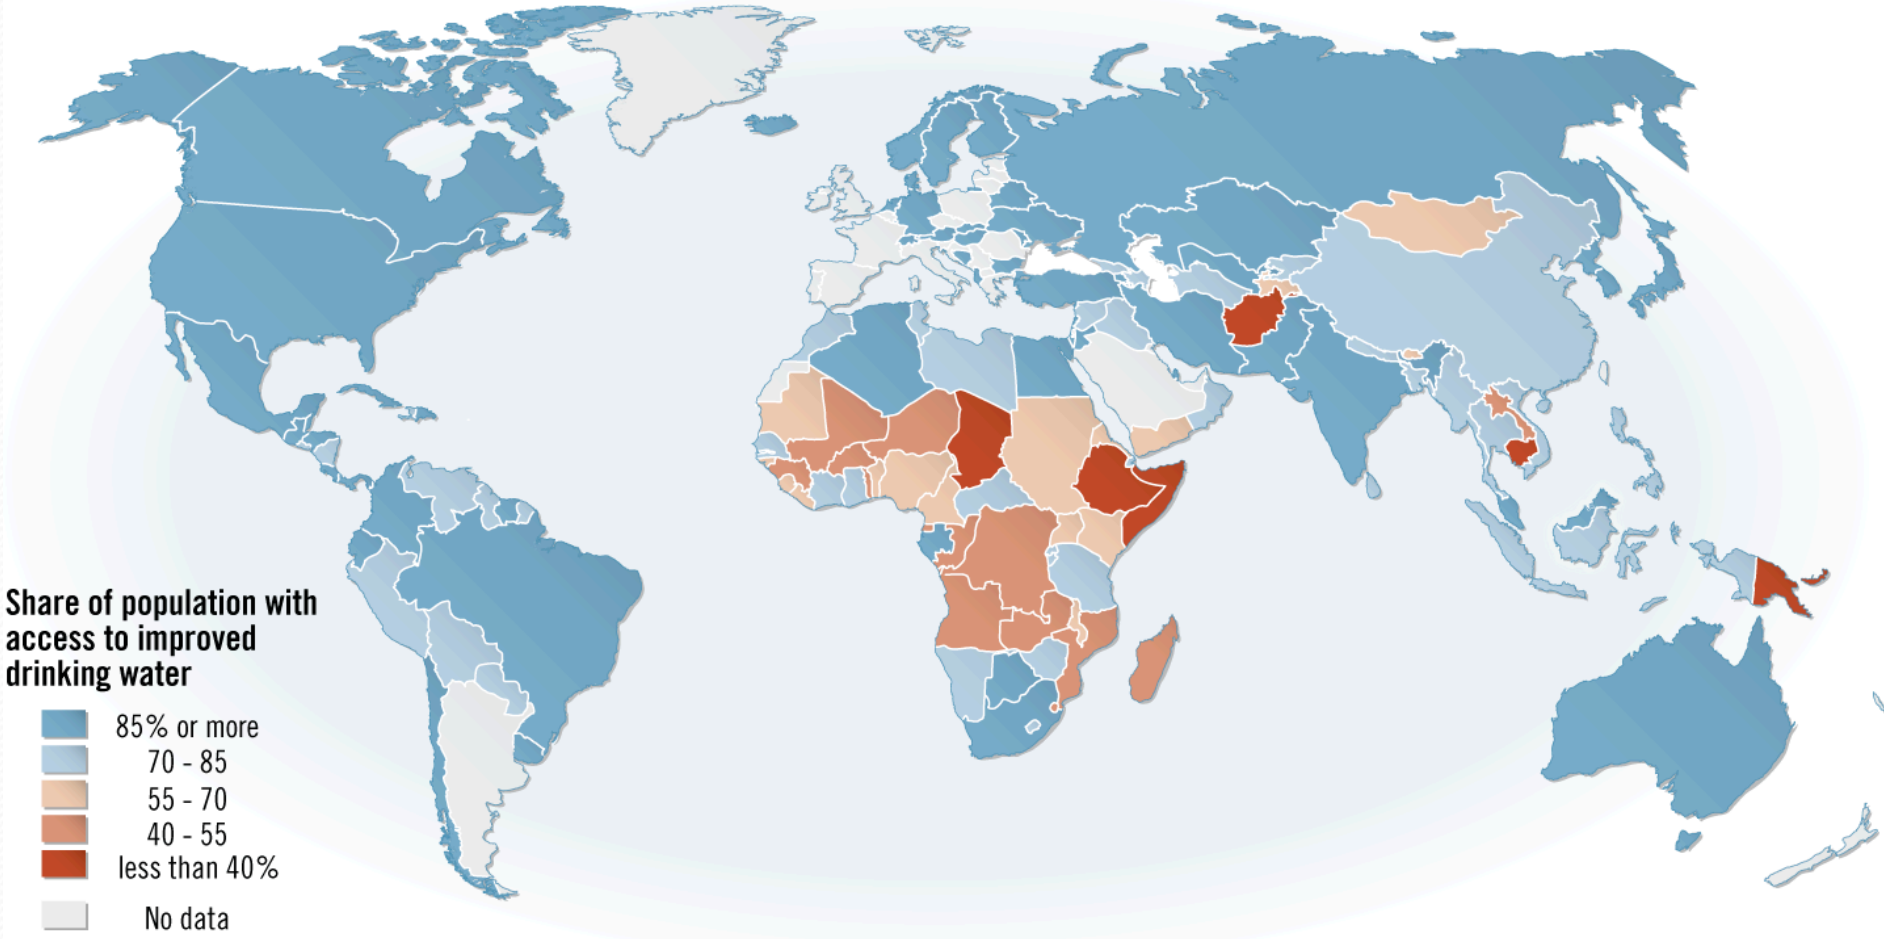
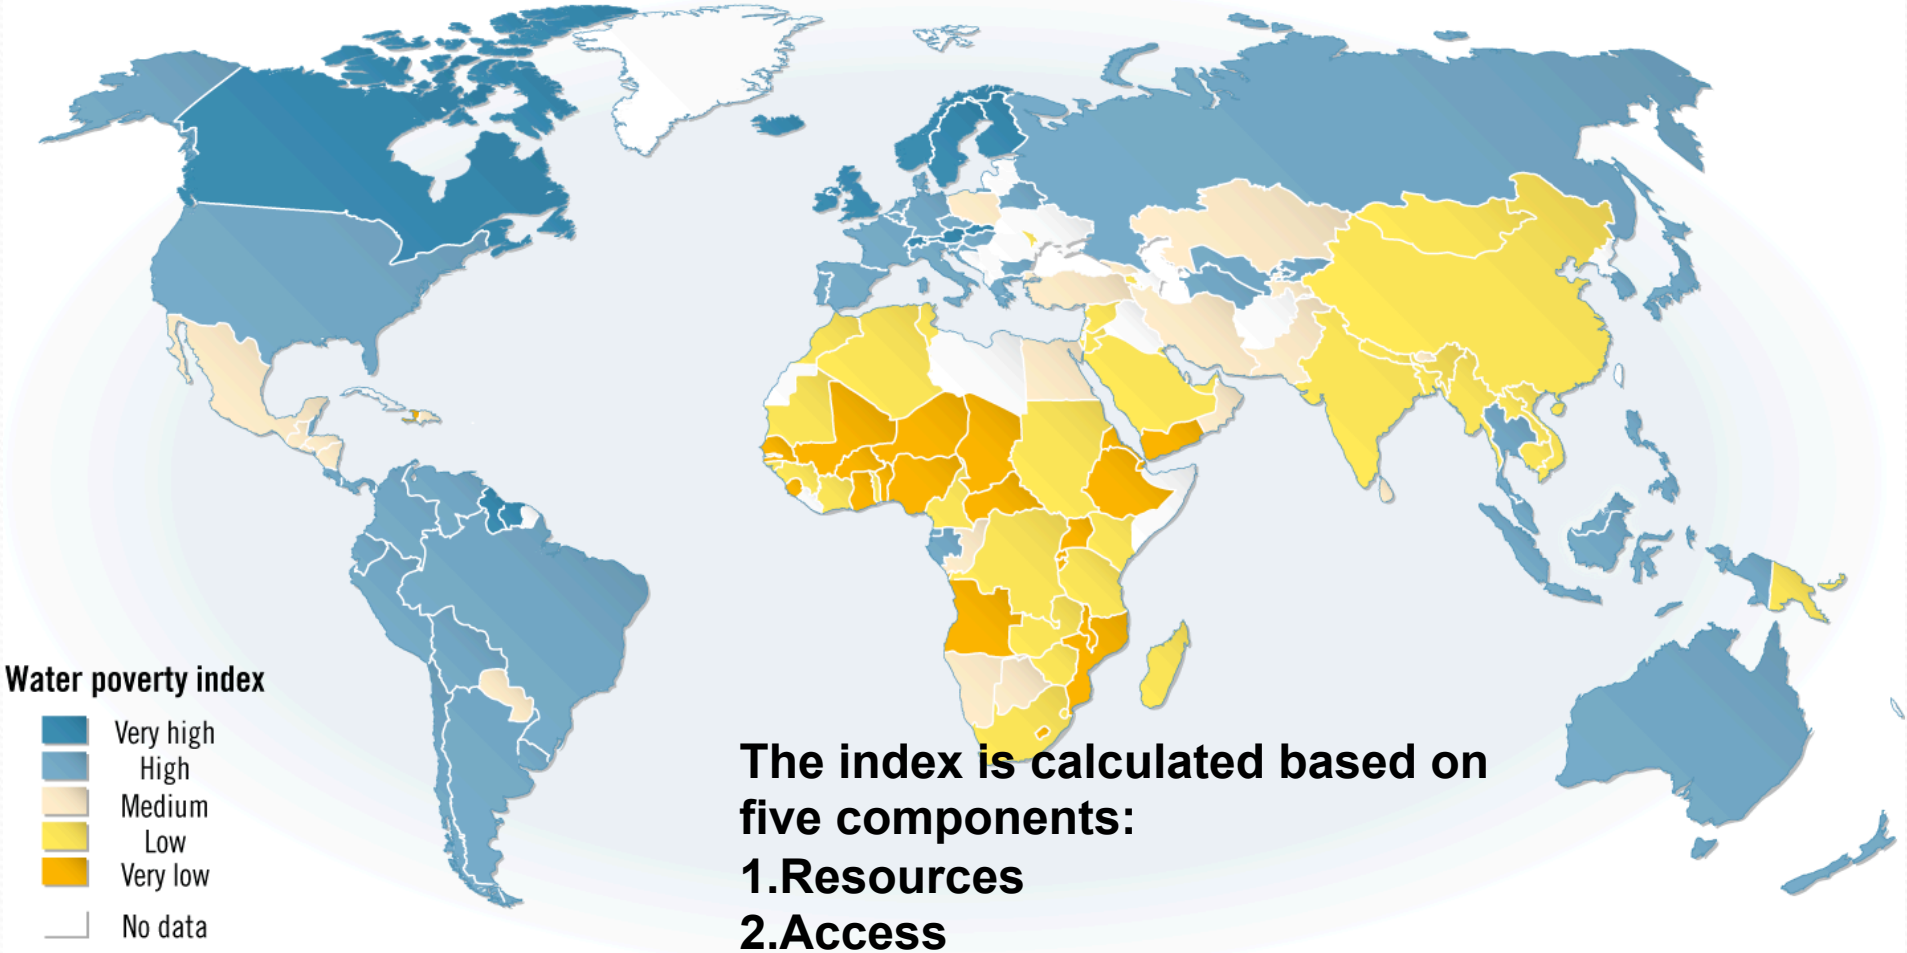
MARCH 2002

Access to Safe Drinking Water

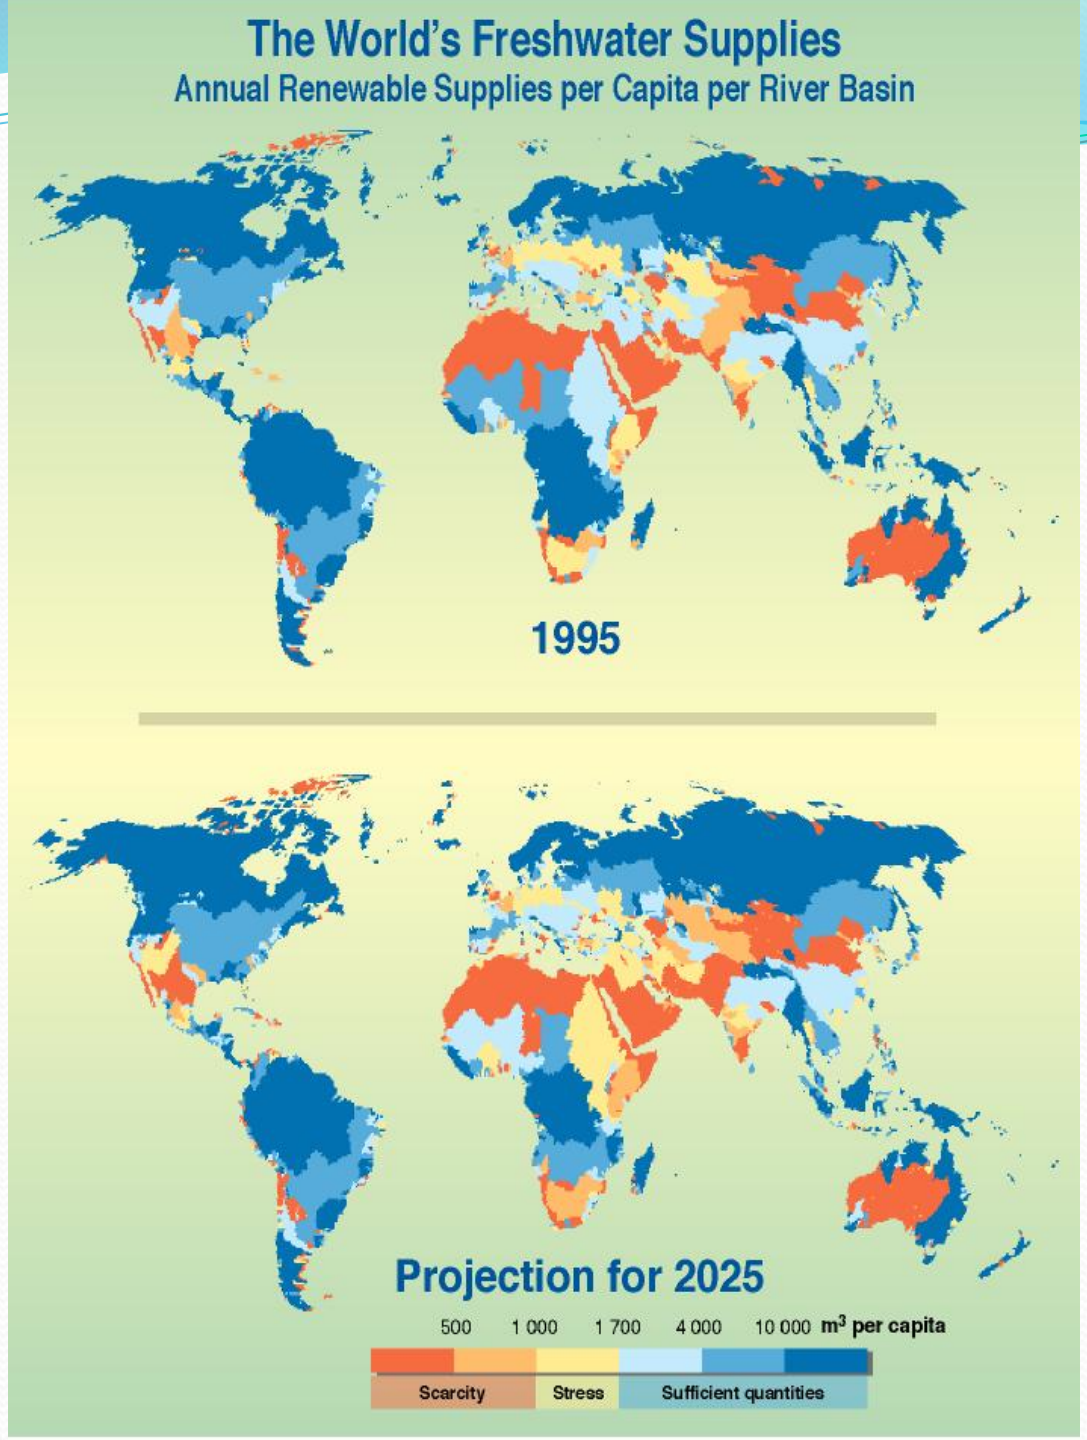


Water Poverty Index



The index is calculated based on five components:

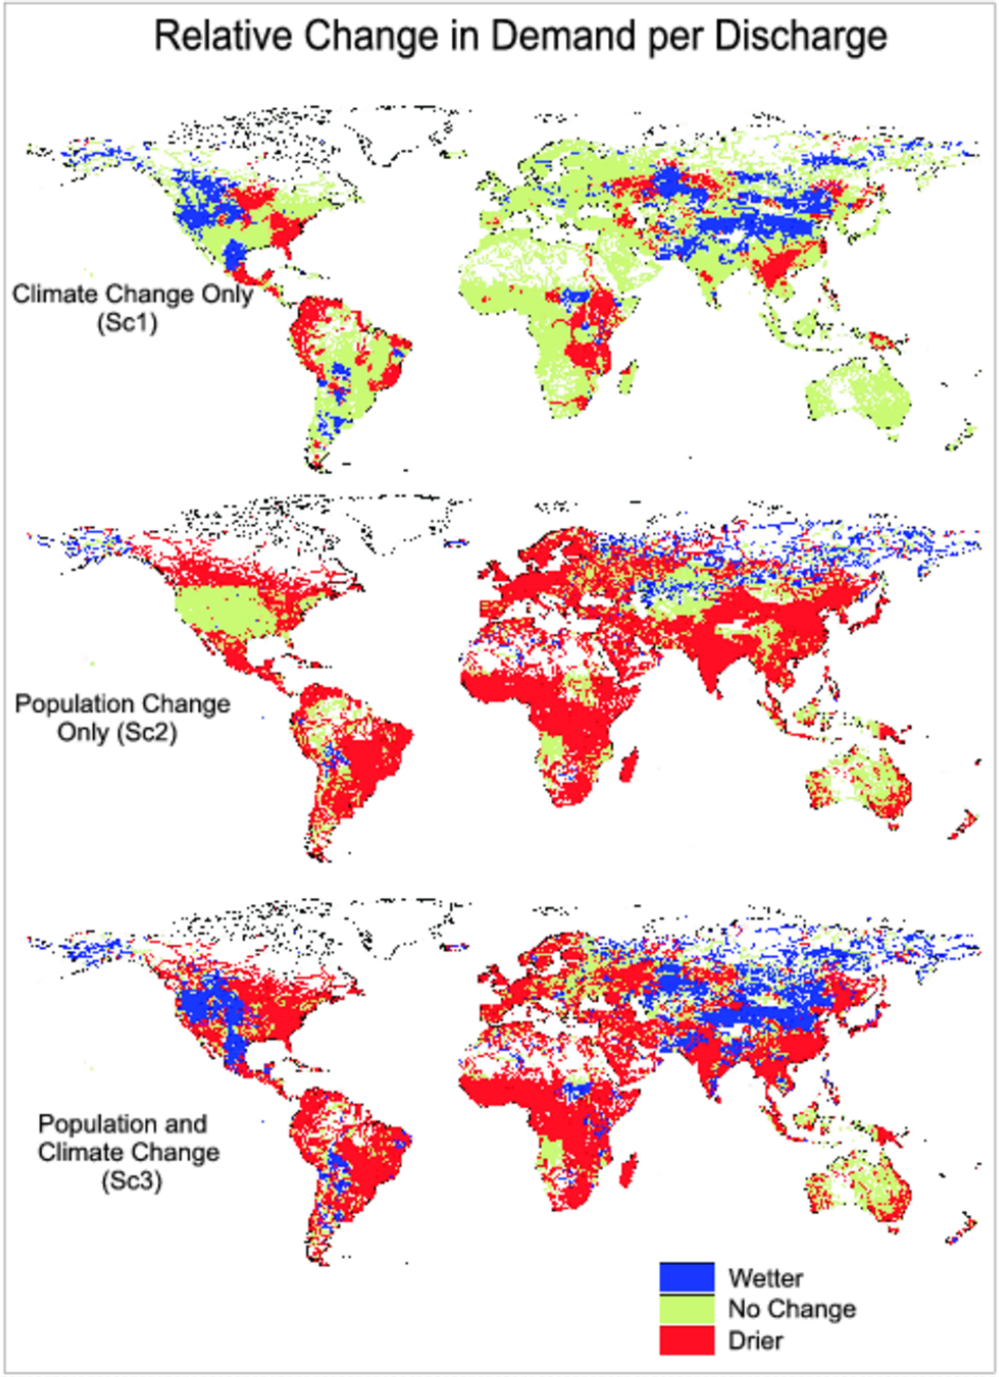
1.Resources
2.Access
3.Capacity, use
4.Environment



The World's Freshwater Supplies
Annual Renewable Supplies per Capita per River Basin
1995
Projection for 2025
500
1 000
1 700
4 000
10 000
m³ per capita
Scarcity
Stress
Sufficient quantities

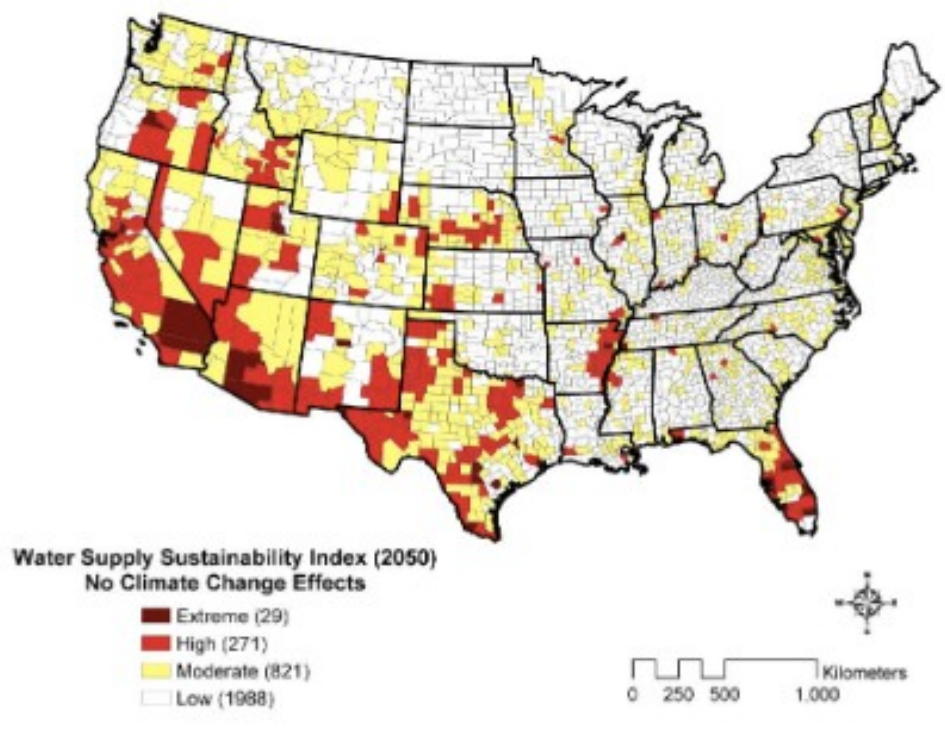
Water Stress Changes to 2025

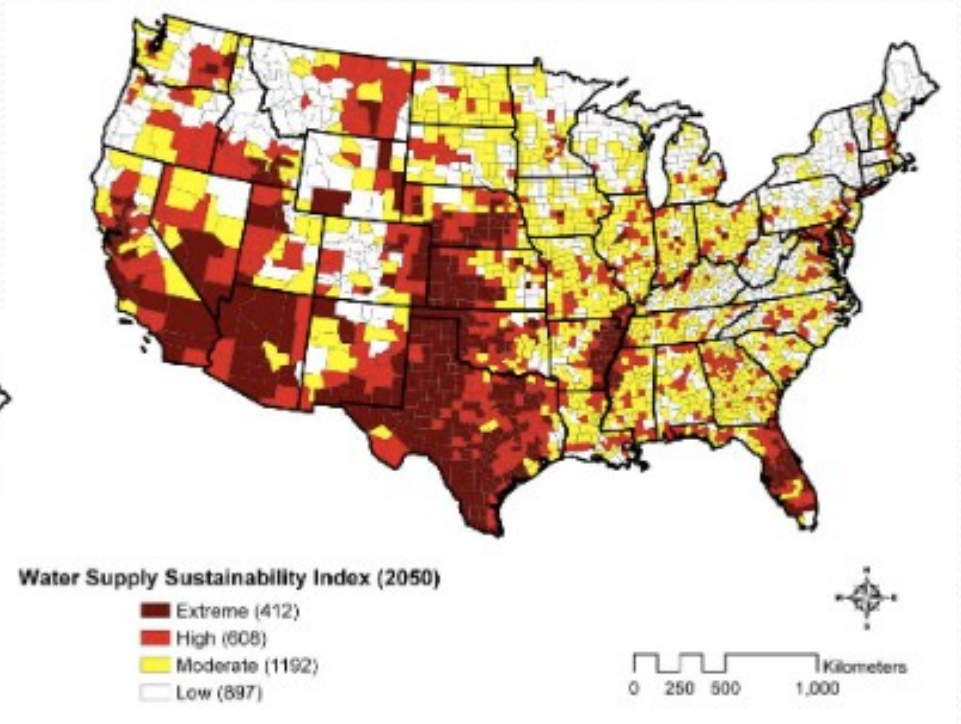
- 80% of future stress from **population development**, **climate change**!
- Future distortions of the water cycle are inevitable
- High resolution operational mapping of water stress important to food, health, international security



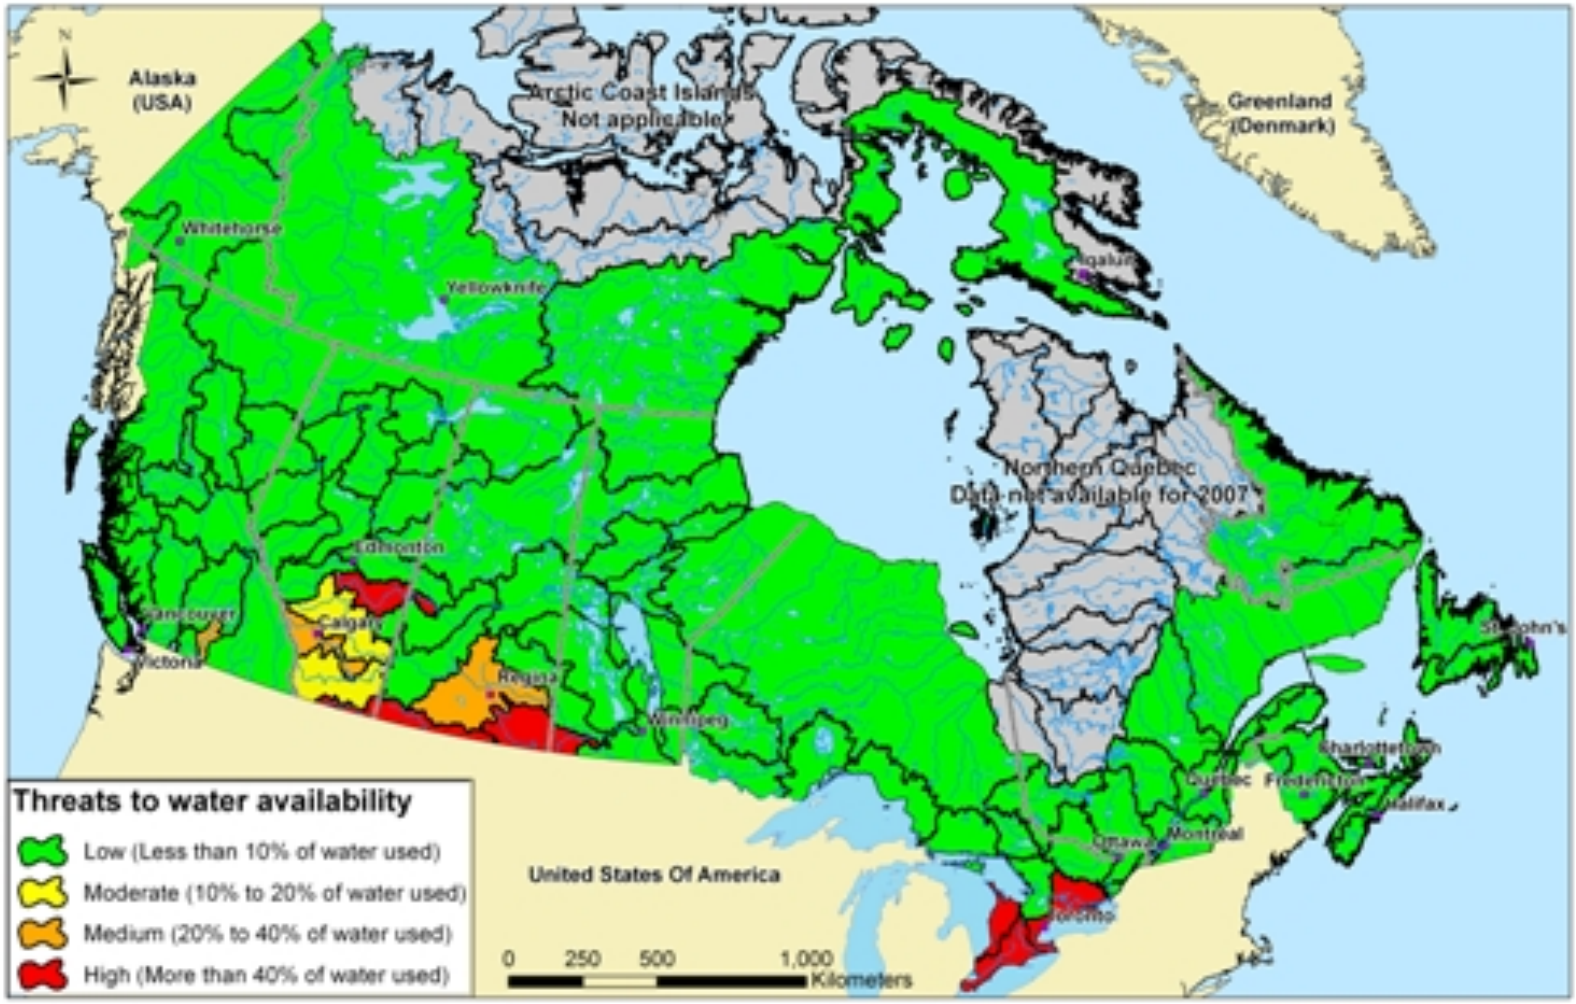
Vörösmarty et al. 2000

Water Stress Changes in the US 2050





And in Canada?



Alaska
(USA)
Arctic Coast Islands

Discussion

Water Resource Management

• **World Bank:** Water Resources Management is the integrating concept for a number of water sub-sectors such as hydropower, water supply and sanitation, irrigation and drainage, and environment.

•An integrated water resources perspective ensures that social, economic, environmental and technical dimensions are taken into account in the management and development of water resources.

• The decision-making, manipulative and nonmanipulative processes by which water is protected, allocated or developed

• **Principles of Water Resources:** Historical, development, management and policy arenas surrounding water resources

The Great Lakes Basin

- A shared resource between Canada and the U.S.
- 20% of the world's surface fresh water
- Drinking water - more than 45M people
- Rich biodiversity
- Vital role in supporting central Canada's economics

Political Stakeholders

History of Great Lakes Environmental Programs

- 1909 - Boundary Waters Treaty established the International Joint Commission (IJC)
- 1970 - National environmental agencies:
  - Environment Canada (EC)
  - U.S. Environmental Protection Agency (U.S. EPA)
- 1972 – Ontario Ministry of the Environment
- 1972 - The Great Lakes Water Quality Agreement (GLWQA)

History of Great Lakes

Past historical disputes and agreements of water flowing along or across the boundary, notably for navigation:

- Europe
- Mexico and United States
- Canada – US Disputes included:
  - St. Mary and Milk Rivers in the west
  - Rainy River
  - the Chicago Diversion of Lake Michigan (which lowered lake levels by 15 cm)
  - St. Mary's River at Sault Ste. Marie and the Niagara River
